- 2 from a base station by receiving a command signal from a mobile station
- 3 requesting it to decrease the transmit power of the downlink channel. In
- 4 response, the base station decreases the transmit power if a hypothetically
- 5 decremented value of the transmit power is higher than a nominal lower
- 6 limit of its power control range, and further decreases the transmit power
- 7 if the downlink channel still has a quality higher than a specified value at
- s the mobile station even when the hypothetically decremented value is
- 9 lower than the nominal lower limit. The base station sets the transmit
- 10 power equal to the nominal lower limit if the hypothetically decremented
- value is lower than the nominal lower limit and the downlink channel
- still has a quality higher than the specified value at the mobile station.
